

Paladin Heavy Construction Product Safety Program

January 1, 2014

As the recognized leader in the construction coupler and attachment industry, we have always placed the highest priority on safety. Since designing the original secondary locking device for operational safety, we have continued to improve our couplers and their safety mechanisms.

We were the first industry manufacturer to commit to a comprehensive Hydraulics and Product Safety Training Program. Utilizing highly experienced staff resources, this program has trained over 10,000 dealers, contractors, operators and mechanics since its inception in 2004. Not only has this training been presented in 34 states, Associated Equipment Manufacturer's Association (AEM) invited one of our trainers to speak at an annual Product Safety and Liability seminar. OSHA has attended some of our classes, as well as, enlisted our training classes for several of their offices.

The construction industry is not without hazards. Many incidents could be avoided with a better understanding of the issues involved. While we have designed one of the safest couplers in the industry, nothing can replace properly trained employees. This is why we continue to offer safety training to those who recognize the need.

Please consider this opportunity to educate your team and your customers in the important product safety issues. To hear more or to schedule a class, please call Scott Adams or Clyde Gesaman at 330-734-3000.

Thank you for your continued support.
